Every product identified.
Every label connected.

Thavino connects product information, packaging identity and controlled labelling for manufacturers, brand owners and supply-chain teams.

Keep the details behind a label together, from the first product record to the history of what was printed.

Product record

Arc sensor

Product ID	SAMPLE-104
Packaging	Case / 12 units
Packaging ID	**SAMPLE-104-C**
Lot	SAMPLE-26
Label version	03

One packaging identity links the record to the case label.

Fictional product, sample data and illustrative barcode.

Less repeated entry.

Use product information in label templates, so changes start with a connected record.

Clearer decisions.

Review the intended version and retain the approvals and print history behind it.

Follow the workflow →

One record.
A controlled path to print.

Connect the information and decisions behind each label. The Arc sensor case shows how a product record becomes reviewed output with a history.

1	2	3	4
Product information	**Packaging identity**	**Reviewed label**	**Print history**
SAMPLE-104	SAMPLE-104-C	Version 03	Output recorded

Product + packaging	Keep identifiers, packaging levels and production details together, with the right record.
Label design	Build reusable, data-bound templates with barcodes, symbols and multilingual content in your browser.
Rules + checks	Surface missing or inconsistent information using reviewed business rules before release.
Review + approval	Manage versions, review responsibilities and release decisions so teams approve the intended label.
Printing + output	Produce labels through supported methods and retain a record of the output.
History + access	Trace changes and approvals, control access by role and export supporting records.

Connection methods and output requirements are agreed during implementation.

Different products. Specific information.

The same connected approach supports different industry needs. Bring the information, label content and review process that apply to your products and markets.

Medical devices

Connect device and packaging identifiers with the applicable lot, serial and expiry details.

Chemicals

Keep formulation-related hazard content, pictograms and market-specific label requirements together.

Food and beverage

Align ingredients, allergens and batch details across packaging variants and label changes.

Pharmaceuticals

Control approved label content, version changes and the evidence behind review decisions.

Consumer goods

Coordinate product variants, packaging levels and languages for market-specific content.

Automotive

Link part identities and logistics units to customer-specific and supply-chain information.

Electronics

Connect model, component and serial information to the content on compact labels.

Logistics + distribution

Link shipping labels and logistics-unit identifiers with checks against shipment information.

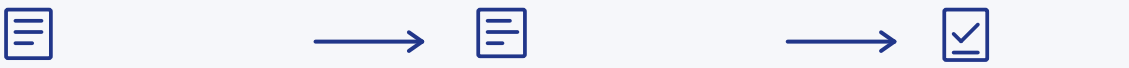

Your requirements shape the data, rules and review workflow.

Keep information connected.
Keep people in control.

A shared product context	Keep product, packaging and label information together so teams work from the same details.
Reusable work	Apply templates and reviewed rules across your label workflows, with less repeated setup.
An explainable history	See the versions, approvals and printing behind a label when a question or change arises.
A focused starting point	Start with one product family, workflow or location, then assess expansion.

AI assists. Your team decides.

AI suggests information from source documents and shows evidence. People accept, correct or reject suggestions before use in controlled workflows.

See your workflow in Thavino.

Bring a sample product record and label. Explore packaging identity, label design, review and print history with the team.
